The science of sleep:

SLEEP STAGES

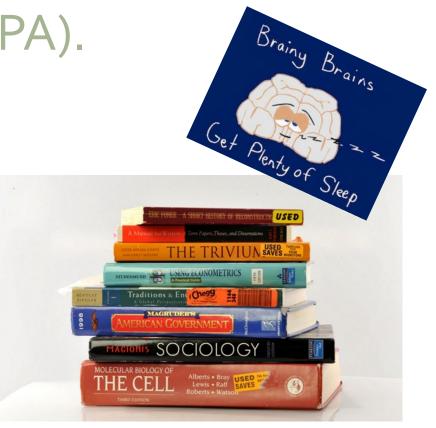

- Sleep occurs in cycles.
- The more continuous sleep you get in a night, the more benefits you receive.
- Most college students need 7-9 hours of sleep every night.
- During slow wave sleep (SWS), your physical body rests and is restored.
- During rapid eye
 movement (REM)
 sleep, memories are
 consolidated via the
 formation of new
 neural connections, and
 human growth
 hormone is released.

It's good for your brain (especially your GPA).

- You might think that sleep is optional or a luxury, but in reality it's one of the most important things you need to succeed academically.
- During sleep your brain actively works to strengthen memory circuits. It also helps prioritize, reorganize, and consolidate the information and skills you learned that day. This means you will have:
 - Increased ability to concentrate
 - Improved recall of information
 - Better performance of new skills

And it's good for your body.

- Sleep restores the body, supports immune system functioning, aids in muscle growth & repair, and improves reaction time.
- Numerous studies have shown that quality sleep is protective against colds and flu.
- Chronic health conditions are better managed with quality sleep.
- Your **emotional health** is strengthened with sleep. Regular sleep builds your resilience and helps you react better to stress.

Prioritize sleep.

- Create a weekly routine including time for classes, work, clubs, meals, socializing, relaxing, and sleep.
- Think about your school day like a work day and use breaks inbetween classes for academic work.
- Be sure to save time for fun too!
- Set and keep a regular sleep schedule, aiming for 7-9 hours per night.

LET'S CU SLEEP!

Set the mood for slumber.

- Limit screens 30-60 minutes before bedtime:
 - Screen light → Decreased melatonin → Increased wakefulness.
 - Use f.lux, Night Shift, etc. to shift the spectrum of your screen lights.
- Create a relax & wind down routine:
 - Try writing things down that you're worried about or grateful for, taking a warm shower, or reading a book for fun.
- Avoid exercising or napping close to bedtime.
- Caffeine, alcohol, marijuana, and other drugs impair sleep.

Set the stage for sleep.

- Keep your room quiet, dark, and cool.
- Try using earplugs, white noise machines, blackout curtains, sleeping masks, and fans.
- Talk with your
 roommates or
 housemates so you can
 create a sleep haven that
 works for everyone.

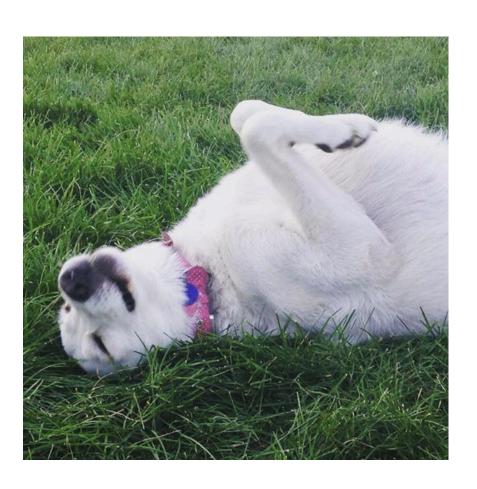

Maintain your sleep haven.

- Only sleep or do other relaxing activities while in bed.
- If you can't fall asleep,
 leave your bed and do something relaxing until you feel sleepy.
- Set and keep a regular sleep schedule.

Power up with power naps.

20-30 minute afternoon power naps can boost alertness and cognitive functioning, while reducing overall stress.

- The short duration of a power nap is designed to prevent you from entering a normal sleep cycle without being able to complete it.
- Set an alarm on your phone to catch a restorative 20-30 minute power nap.
