Ok Google... Tell me a joke.

What did the vapes do when they saw their grandma Juuling? They recoiled.*

* In an e-cig, a coil makes contact with the battery on one side and with the “e-juice” on the other side, thereby turning the liquid into a vapor that can be inhaled.

The risks with e-cigs are no joke.

College students’ brains are still growing. Unfortunately, nicotine exposure disrupts the growth of the same brain circuits that control attention, learning, and susceptibility to addiction. Vaporizers can also generate significant amounts of formaldehyde and other toxins. If you haven’t started vaping, don’t. If you have started and are ready to quit, check out Cornell Health cessation services, including nicotine replacement products.
