Choosing an IUD for your contraception shows that you are seeking birth control that is convenient, reliable and cost-effective. The more you know about your IUD, the more comfortable you’ll feel about having one placed. Be sure to talk with your health care provider at Cornell Health if you have any questions or concerns surrounding your IUD.

Choosing an IUD

Common IUDs available in the United States include the Mirena, Kyleena, and Paragard.

Mirena

The Mirena contains a small amount of the hormone progesterone. This hormone is mainly absorbed into the lining of the uterus with very few, if any, effects on the rest of the body. The progesterone can make periods with the Mirena to be light, sometimes irregular, or absent altogether. About 20% of users have no periods at all after one year with their Mirena. This IUD is effective for 5–7 years.

Kyleena

The Kyleena has the same hormone as the Mirena. It is effective for 5 years. Periods with Kyleena can be light and irregular. Irregular spotting and bleeding may be more common in the first 3–6 months after insertion. After the first year of use, about 12% of Kyleena users had no periods.

Paragard

The Paragard contains copper and has no hormones. Like the Mirena and Kyleena, it works by temporarily changing the physical environment of the reproductive tract, preventing transport of sperm, fertilization, and embedment of an egg. The Paragard will not affect monthly ovulation. For most users, the first few periods with the Paragard can be longer and heavier by about 20%, and somewhat more painful than periods without an IUD. This IUD is effective for up to 10 years.

Effectiveness

All three IUDs are more than 99% effective in preventing pregnancy. They are all rapidly reversible, can be removed at any time by a health care provider, and have no long-term effect on fertility after removal. They contain no estrogen, making them safe for those who have been told that they should not use estrogen.

Like most any procedure, there are some risks associated with having an IUD placed, including:

- Difficulty or inability to place the IUD because of a narrow cervical opening or a uterus that is larger or smaller than ideal for an IUD.
- Infection of the uterus related to insertion of the IUD. This risk is greatest during the first 30 days after placement and occurs in about 1% of placements and, if it occurs, can generally be treated successfully with antibiotic pills.
- Expulsion of the IUD. Most commonly occurring in users who have never had a full term pregnancy, the uterus can spontaneously expel the IUD. This is most common during the first 3 months after placement and has about an 8% risk during the first several months, reducing after the first year. You’ll be taught how to check your IUD strings to be certain your IUD is still in place every month.
- Uterine perforation or embedment can occur in less than 1% of IUD users. This rare complication can make the IUD ineffective or difficult to remove later on.

Cost

The cost of your IUD will be billed to your insurance if Cornell Health is in-network with your insurance plan, or directly to you if your plan is out of network. Your out-of-pocket costs will depend on your insurance coverage. Students enrolled through the Ithaca campus have a $10 copay for the IUD placement procedure at Cornell Health, regardless of insurance coverage. For details, visit health.cornell.edu/costs or speak with your provider.
Planning for placement
You’ll be asked to meet with a sexual health nurse at Cornell Health to help you decide which IUD is right for you. Let us know if you get anxious about Pap smears or procedures and we’ll talk with you about anti-anxiety medication for your appointment.

Plan your placement for a day when you can go home from the appointment and rest if you need to. Some people are more comfortable taking the whole day off on the day of placement, but many are fine returning to normal activities right away.

If your IUD is placed when you are not on your period, we will ask you to have a urine pregnancy test just prior to your IUD placement.

You may have light vaginal bleeding for 1–7 days, with each day getting lighter or heavier, shorter or longer than usual.

You may have some uterine cramping for 1–7 days, with each day getting better.

You may have light vaginal bleeding and spotting for several weeks after placement. This is normal and decreases over time.

The Mirena and Kyleena IUDs can cause irregular bleeding for 3–6 months. You’ll likely return to the normal regularity of your periods with the Paragard within 3 months.

Your cervix will be cleansed with an antiseptic solution.

Next, we’ll measure your uterus to be sure it is a good fit for the IUD and that your cervix is open enough for the placement. You will feel a bit of a cramping sensation at this step.

Some people won’t get beyond this step because of the size of their uterus or the opening of their cervix. We’ll talk with you about whether or not an IUD can still be placed.

Next, the IUD is placed in the uterus. You may feel another cramping sensation. Some people get a little dizzy, nauseated, or sweaty. This is normal and doesn’t last long. Tell us how you are feeling so that we can help you feel better.

Lastly, the IUD strings are trimmed, and you’re done! The whole procedure will take about 10 minutes. Your provider will teach you how to feel for the strings, so that you can check on them in the future.

You’ll be allowed to rest for as long as it takes for any cramping or discomfort to settle down.

After your IUD is placed

- Rest for the remainder of the day if you need to. Use 400–600 mg ibuprofen every 4–6 hours, with food as needed for the first 2-3 days. Most people can return to their work by the next day, using ibuprofen to help with any cramping.

- Some vaginal spotting is normal. If you have your period at the time of placement, your period may end up being lighter or heavier, shorter or longer than usual.

- You may have some uterine cramping for 1–7 days, with each day getting better.

- You may have light vaginal bleeding and spotting for several weeks after placement. This is normal and decreases over time.

- The Mirena and Kyleena IUDs can cause irregular bleeding for 3–6 months. You’ll likely return to the normal regularity of your periods with the Paragard within 3 months.

- When placed within 5 days of the beginning of a normal menstrual cycle, the IUD is already working, and you have no need for additional contraception. You can check your IUD strings as needed.

- If your Mirena or Kyleena IUD was placed after the first 5 days of your cycle, use a backup method such as condoms for the next 7 days.

Paragard IUDs are effective immediately in preventing pregnancy.

Remember that an IUD gives no protection against sexually transmitted infections, so continue using barrier protection if needed.

You may return to exercise and enjoy all usual activities when you are ready.

You can resume vaginal sex after 24 hours of the IUD insertion.

Wait 7 days before using tampons or menstrual cups. Change them more frequently during the first month you use them with your IUD in place.

If you experience worsening pelvic pain or a fever, foul vaginal odor, or significant bleeding (heavier than a normal period) for several days, call Cornell Health and ask to see a clinician

Post-Insertion Visit
You may schedule a 4–6 week post-insertion visit, or an appointment to discuss any IUD concerns.

Taking care of your IUD

- In general, IUDs need little care or attention, but there are a few important things to check.

- For the first few months after insertion, check to be sure your IUD is in place by inserting your index finger into your vagina. Attempt to feel the strings of the IUD up against the cervix. If you cannot feel the strings, or you feel the IUD itself, call Cornell Health for an appointment and be sure to use another method of contraception until you are evaluated.

If at any time you develop vaginal discharge or odor, or significant pelvic pain, call Cornell Health right away (607-255-5155).
